

GP1100, GP2000, GP3000

Highly-configurable, low power solar inverters for residential installations

The GP1100, GP2000, and GP3000 inverters provide maximum energy harvest for smaller PV installations. With significant configuration flexibility, industry-leading reliability and easy jobsite installation, these inverters are ideally suited to the dynamic residential solar market. These units are ideal for integration into new and existing homes and, with proper planning, allow homeowners to expand their PV systems over time.

The inverters are available in extended and standard voltage range versions to best fit the needs of each installation. The Extended Voltage Range (115-500VDC) products offer the industry's lowest MPPT voltage and are the ideal choice for integration with next generation low voltage and building-integrated (BIPV) modules. The Standard Voltage Range (150-500VDC) products are optimized for traditional modules. Together, the entire product line offers the most design configurations across the widest range of PV modules.

Additional flexibility is provided by Green Power's new ETL-listed and NEC code-compliant integration platform for both indoor and outdoor installations. Other system options include different mounting methods, AC and DC disconnects, inverter status display and wired or wireless data monitoring. This flexible approach enables visually pleasing, site-specific configurations that reduce permitting and inspection issues and reduce installation time.

FEATURES

Flexible System Configurations

- Standard (150-500VDC) or Extended (115-500VDC) DC operating ranges
- Lowest MPPT voltage (115VDC) improves compatibility with new low voltage and BIPV modules
- ETL-listed integration platform saves installation time and errors
 - AC and DC disconnects
 - Indoor and outdoor configurations
- Customizable data monitoring interface improves branding and customer experience

Superior Reliability

- Significant software integration rather than complex hardware design
- Field-proven reliability

Easy Installation

- No neutral required with three-wire AC installations
- Meets revised UL1741 standard
- Field-configurable grounding scheme with simple jumper selection
- 10 knockouts for a variety of conduit routing options
- Anti-corrosive NEMA 3R steel enclosure

Technical Support and Field Service.

- Industry leading service reimbursement policy
- NABCEP-certified field service team (*In designated service zones only*)

Optional Performance Monitoring

Performance monitoring solutions are available on all Green Power inverters and include low cost, secure web-based access to PV system status and performance history.
